

FLAGLEAF

User Guide

Mobile app & Telegram bot for agronomists

NZK · pilot · 2026

1. What Flagleaf is

Flagleaf is an agronomist's assistant. Its main goal is to help you treat fields **precisely and economically**: scout the field, get a work plan, and use less chemistry and machinery.

- 🔍 **Field scouting** — walk the field and capture its state (photos or a video with voice narration), **including clean areas**.
- 📅 **Field plan** — from your scouting (which weeds and at what stage), the field's history, and the products the farm actually uses, the bot advises the treatment **timing** (the economic threshold, ЭПВ), **product** and **rate**.
- 💬 **AI assistant** — identify a weed/disease from a photo and ask what to treat it with.
- 📷 **Recognition** — photos of individual weeds/diseases to train the AI (when you're unsure what it is).

You can work via the **mobile app** or the **Telegram bot** — whichever suits you.

2. The app: install & sign in

Install

iPhone (in **Safari**): open `ai.flagleaf.ru/app` → **Share** button → **“Add to Home Screen”** → **Add**. A **Flagleaf** icon appears.

Android (in **Chrome**): open `ai.flagleaf.ru/app` → **“Install app”**.

Sign in

1. Enter your work **email** → **“Send code to email”**.
2. Take the 6-digit code from the email → enter it → **“Log in”**. The session lasts 90 days.

If the address isn't registered you'll see a red hint. Link your email in the Telegram bot with `/myemail you@email`, or get a code with `/weblogin`.

Turn on 🔔 **notifications** and **location** — needed for reminders and so photos carry a GPS tag.

3. Field scouting — the main task

Don't "hunt for a problem" — capture the **state of the whole field**. What matters is seeing **which weeds and at what stage** across the field (families emerge in waves), so you catch the right **treatment timing** (the economic threshold, ЭПВ).

3.1. Scouting mode

1. In the app, on the **Upload** tab, switch on “🔍 **Field scouting mode**”.

2. Pick the field (type a number — e.g. 39 or 76/108).
3. Take photos and video — they all go in as scouting; no need to choose a type.

In the Telegram bot the same is toggled with /scout (same command turns it off; it also auto-expires after 12 hours).

3.2. Video with voice narration

In scouting mode tap “📹 **Scouting video**” and shoot a clip **up to 3 minutes**, speaking what you see (“ragweed here, high density...”). The bot **transcribes the speech automatically** and adds it to the field's data — you don't type anything separately.

3.3. A good photo / video

- Daylight, sharp focus, no flash;
- walk the field in passes — both problem and clean spots;
- **GPS on** — so the plan can talk about zones of the field;
- a photo comment can be **dictated**: tap 🗣️ next to the “Comment” field.

3.4. Control fields

At the top of the screen is a “📍 **Control fields**” list — your fields to scout **regularly (weekly)**. The colour shows how long since you were there:

● up to 7 days · ● 8–10 days · ● over 10 days — time to go.

Tap a field in the list — it gets selected and scouting mode turns on. If a field "goes red", you'll get a reminder.

4. Identify a weed/disease from a photo

When you're **unsure what it is** — switch scouting mode off and upload 2 frames of the single object (wide shot + close-up of the leaf), choosing “**Weed / Disease / Pest**” and the species if you know it. These photos go to recognition (AI training).

You can also just ask: on the **Assistant** tab attach the photo and write “what weed is this and how to treat it?”.

5. The field plan

On the **Assistant** tab tap “📅 **Field plan**” and enter a field number (or in the bot — /plan 39). The bot gathers the weed spectrum from your scouting, the field's history, and the products the farm actually uses, and advises: **what stage the weeds are at and whether it's time to treat (ЭПВ)**, which registered **product and rate**, and **whether one pass is enough or a second is needed**. The

field is sprayed whole — the saving is in the right timing, product and dose, not in treating part of the area.

⚠ The plan is an assistant, not a replacement for the agronomist. You make the decision; use only **registered products** per their instructions.

6. AI assistant

- Ask in plain words: “What can I treat soybean for sow-thistle with?”, “What was applied on field 119?”;
- attach a photo with a question — the bot identifies the object and suggests products for your crop;
- 🌱 set the crop, 🗣 speak instead of typing; buttons: copy / share / 👍 👎 / 📊 dose calculator.

7. Telegram bot

Open the **Flagleaf** bot, tap `/start`. Operation logging: just type or speak what you did — “sprayed field 119 with Korsar 1.5 l/ha” — the bot parses it and records it in CropWise.

Command	What it does
<code>/scout</code>	Scouting mode on/off
<code>/plan 39</code>	Field work plan
<code>/field 39</code>	Field summary (treatment history)
<code>/fields</code>	Your control fields
<code>/history</code> · <code>/stats</code>	Your uploads & stats
<code>/weblogin</code> · <code>/myemail</code>	Web login / link email
<code>/problem</code>	Report a problem

Any field is reachable by number: when uploading a photo choose “Other field” and type the number.

8. If something doesn't work

- No code arriving — check Spam and that your email is linked (`/myemail`).
- App “stuck” — the ↺ **refresh** button at the top.
- No signal in the field — shoot as usual: photos and video are **saved on the phone** and sent automatically when you're back online.
- Any problem — the `/problem` command in the bot.
